

PHILIPS

UV-C lamps & drivers

Lamp-driver compatibility overview

Working together to deliver
cleaner water, air and surfaces,
today and tomorrow

Philips TUV portfolio

Lamp/driver compatibility

This lamp-driver compatibility list provides an overview of which Philips drivers are suitable to be used with all lamps in the Philips TUV portfolio

Current controlled drivers

The Philips TUV lamp portfolio consists of low-pressure mercury lamps in various wattages and dimensions. The most important feature of these lamps is the UV-C radiation, which is defined by the combination of glass used, filling gas and pressure, lamp and ambient temperature and the current of the lamp.

For these lamps it is key that the driver provides the right current to the lamps, as this defines the performance and lifetime behavior of the lamp.

- Low current gives lower UV-C output and can negatively influence the lifetime of the lamp as it damages the coil.
- High current gives higher UV-C output and can negatively influence the lifetime, as this damages the coil rapidly.

Most important is that the current provided by the driver stays within $\pm 20\%$ of the defined current of the lamp.

Philips does not offer a UV specific driver portfolio, as the TUV lamps can also work on some of the existing fluorescent general lighting drivers. These drivers can be a good match while the UV lamp has a different lamp power than the general lighting lamp, it all depends on current. This also means that a driver for a fluorescent general lighting lamp with a similar power as the UV lamp is not by definition a good match with the UV lamp.

For this reason, we tested all our drivers with the UV lamps to make sure we offer the right fit. Most drivers are current controlled and will give only the correct power in combination with the lamp for which the driver is designed. This depends mainly on the dimensions and coil of the lamps. Power driven drivers can support these lamps but only if the manufacturer is aware of the specification of the lamps that will use this driver.

Pre-heat

The pre-heat of a driver supports a good switching behavior and therefore supports a good lifetime of the lamp.

- Low pre-heat can give a cold start which easily damages the coil and therefore shortens the lifetime of the lamp.
- High pre-heat can rapidly damage the coil which can result in a dramatically shorter lifetime.

This is the reason why certain drivers are not suitable for high switching applications. High switching is within this overview defined as more than 8 times ON/OFF per day, based on IEC spec.

The end caps on the linear lamps do not influence the driver selection, which means that lamps with G5 (2 pins on both ends) and 4P SE (4 pins on one end and a blind cap on the other side) can be used on a similar driver.

UV-C output

The influence on the final output of the lamp depends on lamp design but mainly on driver used. For all drivers that are listed in this compatibility overview we guarantee a minimum lamp UV-C output of 90% versus lamp specification.

The specification and connection schemes of all drivers can be found on www.lighting.philips.com/main/prof/lighting-electronics/fluorescent#pfpath=0-GE01_GR

Philips TUV PL-S

Lamptype	Driver	12nc	USA	Europe /Asia	Only suitable for <8 switches per day*	Lamps on Driver
