

Skopje

North Macedonia

In 2021, VINT won two large smart city projects in Skopje city, North Macedonia.

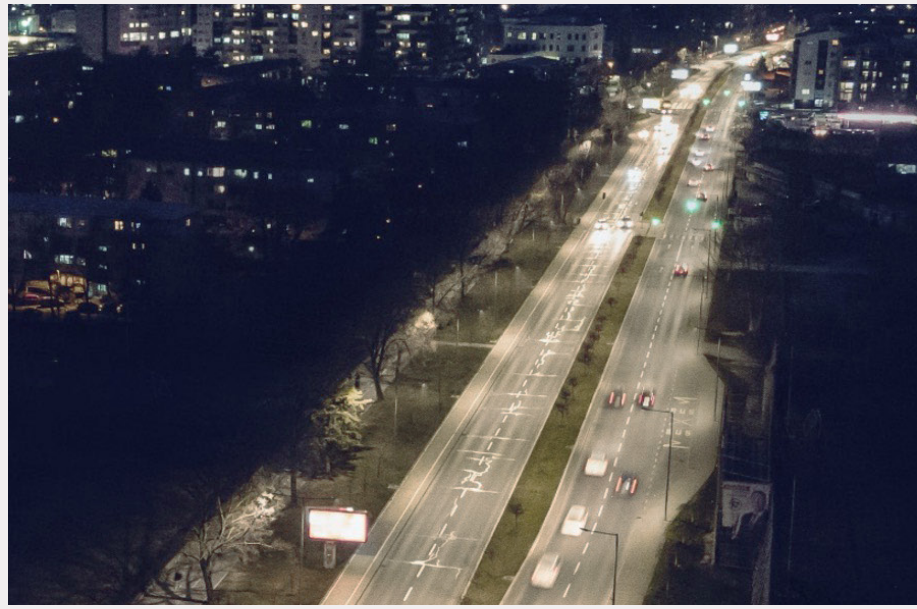

The first project

The first project was for the larger Skopje city and included several boulevards, as well as a number of cross streets. City officials asked for luminaries that were ready for integration into intelligent streetlight control and management systems. Individual control of each luminaire is provided by a NB controller.

The second project

The second project was in Gazi Baba, one of the ten municipalities that make up the City of Skopje, the capital of North Macedonia. The project required a large number of streetlights, together with 4G OLC nodes and the Interact connected lighting management system.

These were **challenging projects**, but with Signify's support we managed to achieve **great results**. Skopje opened the door for Interact implementation in North Macedonia, and Gazi Baba is **the first municipality with a complete Interact interface.**"
