

PHILIPS

TrueLine

Product declaration

Environmental Product Declaration

TrueLine Surface and Suspended

as per ISO 14021, based on ISO 14040/14044

The aesthetically appealing and office-compliant TrueLine is bringing the combination of design and efficiency (up to 140 lm/W with CRI 90) to office spaces. The luminaire offers various benefits such as flexible mounting options, high quality of light and option of delivering both direct and indirect illumination.

TrueLine is also offering the option of getting it connected to various controls as well as software based lighting management systems such as Interact Office. By making the luminaire part of the connected infrastructure, it then becomes an IoT enabled device ready to be used for data collection and other IoT enabled services and innovations that the future brings.

- Best-in-class efficacy up to 140 LPW with CRI>90
- Complies with office lighting norms
- Stand-alone and continuous lines with various lengths - 2Ft, 4Ft, 5Ft, 8Ft & 10Ft.
- Family of Recessed, Surface & Suspended version
- Direct and Indirect light
- 3000K, 4000K, and Tunable White versions available all with CRI>90
- Homogeneous exit window
- Long lifetime L90 at 50,000 hours

Product

Product family range

The TrueLine Surface and Suspended is a product configurator family, the assembly of the products is implemented on the manufacturing site in Signify Poland Sp. z o.o. in Pila, Poland. Since September 2020, Signify achieved carbon neutrality for all its operations across the world as well as using 100% renewable electricity, including the manufacturing site in Pila.

The EPD does not present the assessment of the impacts of the whole range, and focused on representation through the most probable worst case scenario rather than through average impacts with assessment of deviations. This approach is based on the Signify developed EPD framework.

Representative product

TrueLine Surface and Suspended product SP532P LED110S/TW9 SIA U4 L2850 ALU is chosen as a representative product for the family as the luminaire with the highest power consumption over the lifetime, with inclusion of an emergency power supply module. Based on multiple LCA studies of the LED based luminaires, it is defined that the use stage (and electricity consumption in particular) tends to contribute the majority of the life-cycle impacts. Thus, a product with the largest power consumption over the lifetime in the family is most likely to have the largest impacts, and thus represent a worst case. That choice of a product aligns with pessimistic assumptions and the precautionary principle in view of the task to represent other products

in the family. This approach is based on the Signify developed EPD framework.

Product application

The luminaires of the family are designed for a broad range of indoor application, mainly as a general lighting for mid- and high-end office buildings.

Technical Data

The system comprises a set of modules that are the key building blocks for a luminaire. A typical application has the following technical features:

- 3x Xitanium driver
- 15x LBA SlimTW LED boards
- Mechanical parts made of metal or plastic
- Connectors
- Cables
- Sensors

Delivery status

Product weight: 9,71 kg (including 1,13 kg packaging), dimensions of the packed product: 3286mm*199mm*66mm

Driver:

i.	Type	XI 36W 0.08-0.4A 220V SR FLEXTUNE 230V
ii.	Failure rate (max % @lifetime)	10%
iii.	Dimensions, mm	360 x 30 x 21

LED board

i.	Type	LBA SlimTW 1ft 3030 23L 24UP 927 965 H21
ii.	Dimension board, mm	279 x 20
iii.	Amount of PCBA per luminaire	15
iv.	Number of LEDs per PCBA	24

Constructional data

Name	Value	Unit
Dimensions	2851 x 88 x 55	Mm*mm*mm
Luminous flux	11000	Lm
Luminous efficacy	118	Lm/W
Radiation angle	80	Deg
Colour temperature	Tunable White	

Base materials/Ancillary materials

Materials	Mass, kg
Metals / Aluminium	4,175
Plastics / PMMA	1,260
Packaging / Paper	1,118
Electric Comp's / Electronic ballasts with connectors	0,846
Metals / Stainless Steel Painted	0,624
Electric Comp's / Cables TPU	0,549
Plastics / PC (Polycarbonate)	0,235
Electric Comp's / PCB board without components	0,180
Metals / Stainless Steel	0,164
Electric Comp's / Cables / Silicone	0,144
Metals / Steel	0,135
Electric Comp's / Cables PVC	0,135
Electric Comp's / Connectors	0,040

Plastics / Rubber Nature	0,006
Plastics / PA polyamide	0,006
Plastics / PP	0,004
Plastics / PET	0,002
Plastics / PE	0,002
Product weight (including packaging): 9.707 kg	

Manufacturing

Manufacturing of the product is partially done by Chinese suppliers for the LED boards and by European suppliers (Poland , France, Hungary, Germany, and the Netherlands) for the driver and mechanical parts. Some mechanical parts processing (bending and cutting of reflector and painting of the end caps), as well as the final assembly of the luminaire is performed at the Pila site, Poland.

Product processing/Installation

Product can be suspended from the ceiling or mounted directly to surface of the ceiling, in standalone or line version.

Packaging

1.13 kg, including cardboard box, and instructions.

Condition of use

Designed for indoor use in indoor use only, in temperature 10°C to 35°C. Applications may apply dimming or lighting controls to allow further energy saving. The product is used in the European market context and assumed to use the average European electricity mix.

Environment and health during use

The product is compliant with the European RoHS Directive 2011/65/EU of 8 June 2011 on Restriction of the use of certain Hazardous Substances in Electrical and Electronic equipment and with the European REACH regulation (EC) No 1907/2006 of 18 December 2006 on the Registration, Evaluation, Authorization and Restriction of Chemicals.

Reference service life

The RSL is established as 50 000 hours operation, the equivalent of 10 years operation in a retail, or hospitality application (5 000 hours per year), or 20 years operation in a typical office application (2 500 hours per year).

End of life

In the European Union, luminaires fall within the scope of the WEEE directive. Efforts are made to improve collection, reuse and recycling of the product mainly via collective Collection & Recycling Service Organizations (CRSOs). In the end of life, the luminaire is 85% collected and disassembled. The collected parts are disassembled and steel, aluminium, glass, electronic parts, and cables and are sent to recycling. Batteries are collected and sent to treatment. The quantitative assessments are based on a material split and respective recycling rates. Non-collected and non-recycled after disassembly content is disposed to the municipal waste stream where it undergoes separation, preparation and treatment according to the average European statistics. Waste generated in installation and parts replacement are 100% collected and sent to respective treatment.

Extraordinary effects

- Fire: effects of fire can lead to emissions of PBDD/F (brominated compounds).
- Water: no known impacts on the environment following unforeseeable influence of water, e.g. flooding.
- Mechanical destruction: no known impacts on the environment following unforeseeable mechanical destruction.

Further information

Details of the product are published on: <https://www.lighting.philips.nl/>

Calculation rules

Declared unit

Declared product	Value	Declared unit
SP532P LED110S/TW9 SIA U4 L2850 ALU	Unit	1 piece

The declared unit is a luminaire with 3 drivers, 15 LED boards, cables, aluminium, steel and PMMA mechanical parts, and other plastic and metal constructive components totalling a weight of 8,58 kg excluding packaging, providing a luminous flux of 11 000 lm, including luminaire losses. The luminaire, provides sufficient light for a typical office application, operated in a European context for 50 000 hours.

System boundary

Cradle to gate with options

Modules A1-A3 include: raw material extraction, processing, energy and materials and manufacture of modules and packaging.

The following scenarios are also included:

- Transport to installation (A4);
- Disposal of packaging materials (A5);
- Replacement of driver (10% rate) (B3);
- Operational energy use (B6);
- Transport to end of life (C2);
- Waste processing (C3);
- Final disposal for WEEE fraction not recycled (C4).

• Benefits and loads beyond system boundary: Recycling of cardboard packaging, electronics, cables, steel elements of luminaire. (D)

Estimates and assumptions

Background data are used for suppliers' specific processes. Foreground data are used for the assembly of the lighting unit in regards to the components of the luminaire (system). When necessary, generic data was generated based on averaging the data of multiple products of the same category. Data on collection and recycling are based on data of the generic European statistics. The end of life scenario assumes recycling of the separated materials, but does not include energy recovery from incineration of the waste. Representation of the family is assumed on the worst case scenario with largest power consumption over the lifetime, and is not compliant with EN15804+A1.

Cut-off criteria

Where no data was available, items that represent less than 1% of the total product weight were neglected. No excluded flows were of any known particular environmental concern.

Background data

Necessary background data are sourced from the Signify database and the Ecoinvent database v3.8.

Data quality

Specific data used is less than 5 years old. Background data is geographically representative of the production location, and is less than 10 years old.

Period under review

The period under review is the year 2022 for the product composition, RSL, and product performance and characteristics, year 2021 for the energy and material consumption at the assembly factory.

Allocation

Avoided burden approach is applied to allocation of recycled and/or secondary raw materials, as well as loads and benefits beyond the system boundary from material recycling. No loads and benefits beyond the system boundary from energy recovery in the end of life of the product or packaging is included. Energy consumption, material and waste generation at the manufacturing site not attributed to bill of materials of the products, is allocated by partitioning, on the basis of units produced.

Comparability

A comparison or an evaluation of the presented data is only possible if the data to be compared were created according to the Signify/Philips lighting framework and the building context, respectively the product specific characteristics of performance, are taken into account.

LCA: Scenarios and additional technical information

Transport to the site (A4)

Name	Value	Unit
Transport distance	1200	Km
Transport mode	truck, unspecified generic	-
Capacity utilisation incl. empty runs	45	%
Bulk density of transported product	225	kg/m ³

Installation at the site (A5)

Name	Value	Unit
Packaging waste	1,13	kg

Reference service life

Name	Value	Unit
Reference service life	10	Years
Operating hours per year	5000	Hours
Quality of work	L90B50	-
Environment of operation	Average European conditions. No extreme exposure to chemicals or pollution is implied.	-
Usage conditions	Indoor	-

Repair (B3)

Name	Value 1	Unit
Repair process	Replacement of the drivers	-
Repair cycle	0,1	Number/RSL
Resources	0,085	Kg
Transportation distance	4,8	Km
Transportation mode	Van	-

Operational energy use (B6)

Name	Value	Unit
Electricity consumption	4181	kWh
Equipment output	106	W

End of life (C1-C4)

Name	Value	Unit
Collected separately	7,29	kg
Sent to recycling	5,50	kg
Sent to energy recovery	1,36	kg
Sent to landfilling	1,72	kg
Transportation distance from point of use to collection and sorting point	30	km
Transportation distance from collection point to recycling	100	km
Transportation distance from collection point to incineration and landfilling	30	km
Mode of transportation	Truck, unspecified	-

Not all background datasets support the methodical approach of the water and waste indicators. The value of the indicator is therefore subject to greater uncertainty. These indicators are thus not declared. IND is used in cases where the inventory does not support the methodological approach or the calculation of the specific indicator.

The life cycle impact assessment by stage (contribution analysis) is illustrated on the figure on the right:

The use phase of the product is associated with electricity consumption for lighting (stage B6 on the chart) and has the highest and most significant contribution to the overall environmental impacts of the product over its life cycle, in all impact categories apart from abiotic depletion potential (elements) (ADPE). In particular, impacts in global warming potential (GWP), acidification potential (AP), eutrophication potential (EP), and abiotic depletion potential (fossil) (APDF) categories are attributed to the electricity consumption at a rate above 90%. While use phase impacts are significant for abiotic depletion potential (elements) (ADPE), impacts in this category are dominated by the sourcing and processing of the raw materials (stage A1-A3), with total of its contribution over 65%. A1-A3 stage has also significance for impacts in photochemical ozone creation potential (POCP), and ozone layer depletion potential (ODP). In that stage, the impact to the ADPE is mostly due to extraction of virgin materials used to

make electric components, as well as due to extraction and production of metal mechanical elements and cables. The ODP impacts of stage A1-A3 could be attributed to sourcing aluminium and temperature-resistant polymers, while POCP impacts are due to sourcing aluminium, copper and electronic elements. The end of life (stage D on the chart) of the product has a marginal contribution to the reduction of overall impacts in all categories apart from ADPE. There, recycling in the end of life (stage D on the chart) reduces the cumulative impact of production (A1-A3), distribution and installation (A4-A5), use (B3, B6), and end of life treatment (C2-C4) by 26%. This is achieved by high rates of luminaires collection in the end of their service, and high rates of recycling of the metals in the end of life of the luminaire.

Requisite evidence

The measurements are based on documentation and bill of materials of the product.

Collection and Recycling (brochure)

[Ecoinvent](#) (website)

Glossary

ADP (Abiotic Depletion Potential): Impact related to the depletion of non-renewable resources, i.e. fossil fuels (ADPF), metals and minerals (ADPE).

AP (Acidification Potential): Contributions of SO₂, NO_x, HCl, NH₃ and HF to the potential acid deposition, causing a wide range of impacts on soil, groundwater, surface water, organisms, ecosystems and buildings.

EP (Eutrophication Potential): Potential to cause over-fertilization of water and soil, which can result in increased growth of biomass.

GWP (Global Warming Potential): Relative measure of how much heat a greenhouse gas (CO₂, N₂O, CH₄...) traps in the atmosphere. It is calculated over a specific time interval, commonly 20, 100 or 500 years.

LCA: Life cycle assessment.

PCR: Product Category Rules.

PERE: Use of renewable primary energy excluding renewable primary energy resources used as raw materials.

PERM: Use of renewable primary energy resources used as raw materials.

PERT: Total use of renewable primary energy resources.

PENRE: Use of non-renewable primary energy excluding non-renewable primary energy resources used as raw materials.

PENRM: Use of non-renewable primary energy resources used as raw materials.

PENRT: Total use of non-renewable primary energy resources.

POCP (Photo-chemical Oxidation Potential or photochemical smog): Formation of reactive substances (mainly ozone) which are injurious to human health and ecosystems and which also may damage crops.

RSL: Reference service life.
